1. **Introduction**

Abstract *Staphylococcus aureus* is a common cause of nosocomial infection. The purpose of this study was to determine the prevalence of *S. aureus* in the nasal cavity of patients in a tertiary care hospital. A total of 100 patients were screened for *S. aureus* colonization of the nasal cavity. The results showed that 60% of the patients were colonized with *S. aureus*. The study also found that the colonization of the nasal cavity was significantly higher in patients who had been in the hospital for more than 48 hours. These findings suggest that the nasal cavity is a reservoir for *S. aureus* and that colonization of the nasal cavity may be a risk factor for nosocomial infection.

1. **Identifying the problem**
What is the problem that the business is facing? What are the symptoms of the problem?
 2. **Identifying the cause**
What is the cause of the problem? What are the underlying factors that are contributing to the problem?
 3. **Identifying the solution**
What is the solution to the problem? What are the steps that need to be taken to solve the problem?

Effective control practices identified:

Most workers were not wearing their gloves and properly sanitizing their hands. There will be the focus of new measures.

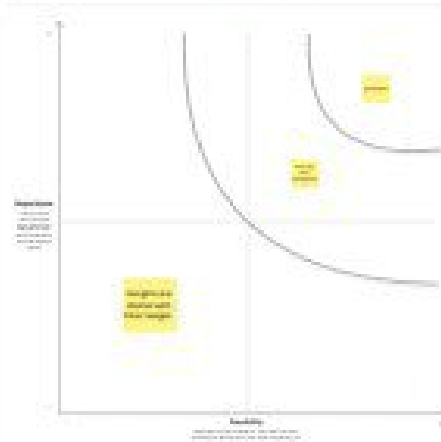

Abstract

Abstracts provide a concise summary of the main points of a research paper. They are essential for researchers to quickly assess the relevance of a paper to their work. Abstracts are typically found at the beginning of a paper and are often used to create a table of contents for a collection of papers.

[illegible]

Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the health-related quality of life (HRQL) of sedentary, middle-aged, obese women. The study was a randomized, controlled trial. The intervention group (IG) participated in a supervised walking program, 3 times per week, for 12 weeks. The control group (CG) did not participate in any exercise program. The IG showed significant improvements in physical function, role limitation due to physical problems, and social functioning compared with the CG. The IG also showed significant improvements in the physical component of the SF-36 compared with the CG. The IG showed no significant improvements in the mental component of the SF-36 compared with the CG. The IG showed no significant improvements in the total score of the SF-36 compared with the CG. The IG showed no significant improvements in the physical component of the SF-36 compared with the CG. The IG showed no significant improvements in the mental component of the SF-36 compared with the CG. The IG showed no significant improvements in the total score of the SF-36 compared with the CG.
